

Corstead Checklist Review - Correction Notes

Only checklist items that need correction, clarification, or cannot yet be tested are included below.

Corrections and Clarifications

Item #3: Custom Fields

Status: Needs Correction / Partially Complete

Issue: Custom fields can be created in Settings, but the fields are not appearing on Prospect or Customer profiles.

Correction / Requirement:

- When an Admin creates a custom field in Settings, that field should automatically appear on every Prospect and Customer profile within that company account.
- The field should be available for users to enter or select a value directly on the profile.

Item #6: Email Communication Deactivation

Status: Needs Correction / Not Fully Implemented

Issue: The expected email deactivation and unsubscribe behavior is not visible on the profile.

Correction / Requirement:

- Every customer-facing email should include an Unsubscribe link.
- If a customer unsubscribes, keep that email address on the profile but deactivate it for email sending.
- If an email bounces, automatically deactivate that address so Corstead does not continue sending to it.
- Allow an authorized user to manually deactivate an email address when a customer asks not to receive emails.
- Show the reason the address was deactivated, such as Customer Unsubscribed, Email Bounced, or Manually Deactivated.
- Allow an authorized user to reactivate the email address later if appropriate.

Item #7: Email Routing by Contact

Status: Needs Correction / Not Implemented as Intended

Issue: Each email address on a profile needs its own communication-routing setting.

Correction / Requirement:

- Under Contacts, allow each email address to be assigned one of these options: All Emails; General Emails; Billing; Estimates; General and Estimates; Billing and Estimates; General and Billing; None.
- None does not deactivate the email address. It only means that address is not assigned to receive routine communication categories.
- This routing setting is separate from unsubscribe, bounce, and manual deactivation behavior in Item #6.

Item #15: Convert Accepted Estimate to Job

Status: Needs Correction / Blocking Workflow

Issue: The conversion screen can be completed, but the Schedule One Job button in the bottom-right remains inactive and cannot be clicked.

Correction / Requirement:

- Once all required job and scheduling information is completed, Schedule One Job should become active.
- The office user must be able to complete the prospect-to-customer conversion and create the scheduled job.

Item #23: Correct Quote Status

Status: Needs Correction

Issue: When using Correct Status on a quote, Accepted is not available as a selectable status.

Correction / Requirement:

- Add Accepted as an available option in the Correct Status workflow so an authorized user can manually correct an estimate or quote to Accepted when needed.

Item #31: Customer-Facing Service Descriptions

Status: Add / Clarify Requirement

Issue: Service descriptions need to be clearly separated from internal job and crew notes.

Correction / Requirement:

- Every service line item on a quote or estimate should have a customer-facing Description explaining what the customer is receiving.
- Every service line item on a job or work order should also retain a customer-facing Description.
- This applies to both Prospect and Customer workflows.
- When an accepted estimate becomes a job, the service description should carry forward with the accepted service.
- Keep customer-facing Service Descriptions separate from Job Notes and Tech / Crew Notes.
- Job Notes and Tech / Crew Notes are internal operational notes and should not automatically be shown to the customer.

Blocked Until Email Is Connected

Items #20, #21, #22, #24, #26, and #28 are currently **Blocked / Unable to Test Yet** because email capability is not connected in Sandbox 2.

Lute needs to complete the email provider/setup before these items can be properly tested. These items should not be treated as failed or needing correction solely because email is not yet connected.

Once email is active, retest all six items together.
