Video 01 | Customer & Prospect Profile Layout

October 19, 2026 • Summary and cleaned full transcript

PART 1 | POINT-BY-POINT SUMMARY

This section distills the issues and requested changes discussed in the video. The cleaned full spoken transcript starts on the following page.

01. Purpose of the video Show the problems employees are experiencing with the current Corstead customer and prospect profiles before walking through the preferred design in The Customer Factor.

02. Customer creation is not the main issue Adding a new customer is relatively straightforward. That process may still need adjustment to match the redesigned interface.

03. Existing profiles are overcrowded Opening a customer or prospect profile reveals a busy layout that makes essential information difficult to find and read.

04. Important information appears in the wrong order Linked Profiles, General Notes, Custom Fields, record information, and account settings are placed too prominently. Contact information should come first.

05. Editing takes too many steps Changing contact information requires navigating to an Edit control, returning to the fields, and navigating again. Routine changes should be made directly where the information appears.

06. Essential information is scattered Overview, Profile Details, Contacts, Properties, and other sections force users to click through multiple tabs. Basic information should be consolidated onto one readable, editable page.

07. Secondary actions still need easy access Staff should be able to schedule estimates and services, review jobs and communication history, and handle invoices without crowding the primary profile view.

08. Header statistics distract from daily work Total Jobs, Total Revenue, Last Service, and window-related summaries are not top priorities for office staff or field technicians. Remove them from the prominent header or relocate them.

09. Design around real operational speed An office employee working through 25-50 weekend emails, someone helping a customer live on the phone, or a field technician looking up an address or notes must be able to move quickly.

10. Training and adoption are concerns The current number of tabs and actions creates a steep learning curve. The goal is basic proficiency in a day or two of normal use, without extensive training.

11. Reference and implementation direction Use The Customer Factor as a reference for simpler organization, but do not copy it exactly. Preserve Corstead’s useful existing functionality while condensing and reorganizing the experience.

PART 2 | CLEANED FULL TRANSCRIPT

Faithful to the recorded narration, with filler and repeated phrases reduced for readability. No substantive requests or examples have been intentionally removed.

I want to make a brief video here because I don't want to spend too much time focusing on the current layout of Corstead, since I want to change it. But I do want you to see some of the issues we've been having.

As far as adding a customer, that's not that big of a deal. It's actually pretty simple. I'm not against the way that part works, but I think we're going to have to change it as well as we change the overall design.

The biggest issue is when a customer or prospect has already been created. For example, if I have a specific customer on the phone, or if I'm a user going through 25 to 50 emails that came in over the weekend and I'm trying to knock things out quickly, the profile is not set up to let me see everything efficiently.

When I click on a profile, it is really busy. If I need to access this customer, Linked Profiles is not important enough to be at the top. General Notes should not be at the top. Custom Fields should not be at the top. The record information doesn't mean anything to the person using this. Even Account Settings shouldn't be one of the first things they see.

The first thing should be the contact information, and the user should be able to edit it easily. Right now, if I want to edit the contact information, I have to go up to the Edit button, click it, come back down to the information, and then go back up again. That's an unnecessary set of steps.

Some of the higher-volume businesses we're going to sell this to have phone calls coming in left and right, along with text messages and emails. That extra step, repeated a hundred times throughout the day, adds time. It isn't efficient. We definitely need to clean that up.

Another issue is that too much information is spread out. I have information on the Overview page, but then I have Profile Details with other information. Then I go to Contacts, and then Properties. I have to keep clicking through these sections. I should have all of this essential customer information on one easy-to-read and editable page.

If I want to dive deeper into the profile, that's fine. I might need to schedule a quote, schedule a service, or look at job history. I might want to look at contact history to see when we've emailed or texted the customer. Or I might want to look at invoices. All of that is great, and those functions need to be available, but the basic customer information should not be so difficult to access.

We're having several problems with this profile setup. First, it is really hard to train people on. It's extremely busy. For somebody who's never seen the software before, trying to explain how all of this works is just too much. It is going to take them a long time to learn.

Second is efficiency. As I just demonstrated, it's difficult to work through profiles, get the main information you need right away, and edit it on the fly. A lot of companies have office staff who will be using these profiles while they're live on the phone with a customer. That means the process needs to be fast.

A customer might call, and the employee needs to pull up that customer's information immediately. The customer might give updated contact information and ask to schedule an estimate. Then maybe it's an existing customer who needs another service, or someone who wants to pay an invoice. Right now, it takes a lot of clicks to get to these different points. The information also isn't particularly easy to read. That's feedback I've received from our staff as well.

Another thing is the information across the top. I don't really care about Total Jobs, Total Revenue, Last Service, or the window-related summary being displayed there. For the person who is actually using this software, that information doesn't mean much in the moment. The company owner may care about some of it, but it isn't what the employee needs first.

Think about the person whose job is answering phone calls, text messages, and emails. Or think about a technician out in the field who opens a profile because they need the customer's address or phone number, need to review the job notes, or need to add a quote or a job. For those people, it's simply too much to click through.

That's why I wanted to point out these issues with the profiles. The information is there, and we're building some good functionality. We just need to organize it better and maybe condense some of the sections.

What I'm going to do next is walk through The Customer Factor. My hope is that, by showing how The Customer Factor has everything laid out, we can mirror something very similar in Corstead. It doesn't need to be exactly the same, but I want a very similar level of efficiency.

One reason people like The Customer Factor is that it's easy to train employees on and easy to use. You don't have to go through an extensive training course. Most people can at least figure out the basics within a day or two of using the program.

The Corstead layout we have right now would require a much more extensive training program to keep up with. That's what I want us to avoid as we redesign the profiles.
