

Here is the full consolidated edit list with enough detail to be clear for development without overexplaining.

 Edit

Corstead CRM Edit List

Prospect and Customer Profiles

1. Move Residential / Commercial Selection to the Top

When creating a new prospect or customer, move the **Residential / Commercial** designation to the very top of the form.

This should be one of the first selections made. We also want the ability to eventually have different forms depending on whether the account is residential or commercial.

2. Replace Window and Property Details With Custom Fields

Remove the current **Window and Property Details** section and replace it with a **Custom Fields** section.

The section should be blank by default and allow users to create fields based on what they want to track, such as:

- Property details
- Tools needed
- Site-specific information
- Other customer or property information

These fields should become part of the profile and be usable when searching, filtering, and organizing customer data.

3. Fix the Custom Fields Section

The current Custom Fields box does not allow the user to actually add custom fields.

The user should be able to create, name, and add custom fields directly from the profile.

4. Automatically Set Customer Since Date

The **Customer Since** date should automatically populate when the account is created.

The user should not have to enter this date, and it should not be manually editable.

5. Remove Preferred Contact

Remove the **Preferred Contact** field from Account Settings.

6. Remove Sending Preferences

Remove the current **Sending Preferences** field from Account Settings.

7. Allow Email and Text Communication to Be Deactivated

If a customer or prospect does not want to receive emails or text messages, the applicable email address or phone number should be deactivated for that type of communication.

The phone number or email should remain saved on the profile, but the system should prevent it from being used while deactivated.

It should be possible to manually reactivate it later.

Contacts

8. Connect Names to Phone Numbers and Emails

Allow multiple phone numbers and email addresses on both prospect and customer profiles.

Each phone number and email address should have the name of the individual connected to it so users know exactly who each contact method belongs to.

9. Send Communications to the Specific Contact

When sending an email or text message, the communication should use the name connected to that specific phone number or email

address instead of automatically using the primary contact.

For example, if John Doe is the primary contact but Jane Doe receives invoices, an invoice sent to Jane should be addressed to Jane.

This may be later functionality, but the contact structure should support it.

Properties and Service Addresses

10. Allow Multiple Service Addresses

Both residential and commercial profiles should support multiple service locations.

Each profile should have:

- One **Main Service Address**
- The ability to add additional service addresses or locations

All locations should remain connected to the same prospect or customer profile.

11. Add Street Address Auto-Complete

When entering an address, the system should suggest matching addresses as the user types.

Once an address is selected, it should automatically fill in:

- Street address
- City
- State
- ZIP code

12. Remove Property Checkboxes

When adding a property, remove the following checkboxes:

- Has Screens
- Hard Water
- Has Tracks

13. Simplify the Add Property Screen

Also remove the following fields from the Add Property screen:

- Gate Code
- Access Notes
- Windows
- Stories
- Type

The property form should stay focused on the basic service-location information.

Profile Details and Dropdowns

14. Allow Profile Dropdown Lists to Be Customized

Under Profile Details, the user should be able to add and remove options from dropdown lists such as:

- Profile Type
- Payment Terms
- Profile Group
- Marketing Source

If a user adds a new option, that option should then be available across all prospect and customer profiles.

For example, if **Facebook Ads** is added as a Marketing Source, it should appear as an option on every profile going forward.

The user should also be able to remove options that are no longer needed.

Estimates and Quotes

15. Schedule an Estimate While Creating the Prospect or Customer

When creating a new prospect or customer, the user should also be able to schedule the estimate during the same setup process.

The user should not have to finish creating the profile and then start a completely separate workflow just to schedule the estimate.

16. Create Quotes Directly From the Profile

Under the **Quotes** tab on both prospect and customer profiles, add the ability to create a new quote directly for that account.

The quote should automatically be connected to that prospect or customer.

17. Convert an Accepted Prospect Quote Into a Customer and Job

For a prospect, once the quote is accepted, the user should be able to manually select **Convert to Customer and Job**.

That action should:

- Convert the prospect into a customer
 - Move the profile into the customer database
 - Create the job from the accepted quote
-

Prospect Workflow

18. Do Not Allow Jobs to Be Scheduled Directly From a Prospect

A prospect profile should not have the ability to directly create or schedule a job.

The prospect should first have an estimate or quote.

Once the estimate or quote is accepted, the user can manually convert it into a customer and job.

19. Remove the Prospect From the Prospect Database After Conversion

Once a prospect is converted into a customer, the prospect should no longer remain in the Prospects database.

All existing information should transfer into the customer profile, including:

- Contact information
- Properties
- Notes
- Quotes and estimates
- History

The account should then appear only under Customers.

Profile Management

20. Add Delete Buttons to Prospect and Customer Profiles

Add a **Delete** button to both:

- Prospect profiles
- Customer profiles

The user should have the ability to permanently remove either type of profile when necessary.

21. Fix Profile Archiving

When archiving an entire prospect or customer profile, the system currently gives a warning that another contact must be promoted before archiving the only active primary contact.

That warning should not appear when archiving the entire profile.

The user should be able to archive the full prospect or customer profile regardless of the primary contact.

Archived profiles should also:

- Remain searchable
 - Be clearly identified as archived
 - Have an option to be unarchived and restored
-

Services

22. Add and Manage Services From Prospect and Customer Profiles

When creating a job, the user currently cannot select or add services.

The user should be able to add and delete services from the prospect or customer screen.

When a new service is added, it should also be added to the company-wide **Service Catalog** and then become available across all prospect and customer profiles.

A service added once should not have to be recreated separately for every customer.
