

Corstead CRM Edit List

Current Development Updates

1. Add the Sub-Customer Option

Area: Customer Profiles

- Add an active Create Sub-Customer option to customer profiles.
- Residential example: Jane Smith is the main customer and Karen Smith can be created as a sub-customer under Jane while keeping her own contact information, service address, estimates, jobs, invoices, and notes.
- Commercial example: One ownership entity can have multiple businesses or locations underneath it, with work tracked under the correct business or location and billing directed to the main ownership entity when needed.
- V1 should support one parent-customer level with multiple sub-customers, but no multiple nested levels.
- Each sub-customer should retain its own name or business name, contacts, service locations, estimates, jobs, invoices, and general notes.
- Add a Bill To setting for each sub-customer: Bill the parent customer or bill the sub-customer directly.
- Searching for the parent or sub-customer should clearly show the relationship, and the parent profile should display all connected sub-customers.
- Estimates, jobs, and invoices should identify both the sub-customer and the applicable service location.

2. Implement Address Autocomplete

Area: Addresses and Locations

- As the user types an address, show suggested matching addresses.
- When an address is selected, automatically populate street address, city, state, and ZIP code.
- Apply this to primary customer addresses, additional service locations, sub-customer addresses, and commercial locations.
- Users should still be able to manually enter or correct an address when needed.
- This should be treated as a missed implementation item rather than new scope.

3. Make General Notes Immediately Visible

Area: Customer and Prospect Overview

- General notes should be visible directly on the customer and prospect Overview screens instead of being hidden inside Profile Details.
- Add a clearly labeled General Notes card that shows the latest or most relevant notes and allows the user to add or edit notes directly.
- Show who added or edited the note and when.

- Keep general customer information separate from job-specific, estimate-specific, and location-specific notes.
- A separate General Notes tab is not necessary for V1 unless notes are stored as individual chronological entries.

4. Display Estimate Statuses

Area: Estimates

- Both prospect and customer profiles need visible estimate statuses.
- Show the status in the Estimates list, at the top of the individual estimate, and anywhere the estimate appears in scheduling or reporting.
- V1 statuses: Draft, Sent, Viewed, Accepted, Declined, Expired.
- Update status automatically when possible: sending changes Draft to Sent, opening changes Sent to Viewed, approval changes to Accepted, rejection changes to Declined, and passing the expiration date changes to Expired.
- Authorized employees may manually correct a status, but that correction should be recorded in activity history.
- Use the same status structure for estimates under both prospects and customers.

5. Add Communication History to Every Profile

Area: Communication and Activity

- Add one tab labeled Communication & Activity to both prospect and customer profiles.
- For every email or text sent through Corstead, record date and time, communication type, recipient, email subject or short text preview, communication purpose or type, related estimate/job/invoice, employee who sent it, and delivery status when available.
- Examples: Estimate #1042 Sent, Invoice #2088 Sent, Appointment Reminder, Marketing Email: Fall Window Cleaning, Custom Customer Message.
- Show newest activity first.
- Allow filtering by All Activity, Email, Text, and Profile Changes.
- V1 should automatically record communications sent from within Corstead. Outside communications should only be tracked when an integration provides that information.

6. Add Employee and Profile Audit History

Area: Audit History and Accountability

- Use the same Communication & Activity tab to show who has performed important actions on the profile.
- At minimum, record who created the profile, profile creation date and time, who last edited it, date and time of saved edits, important fields changed, previous and updated values for major changes, and who archived or unarchived the profile.
- Also record who created, edited, sent, accepted, or declined an estimate; who scheduled, rescheduled, completed, or canceled a job; who created or sent an invoice; and who recorded a payment.

- The audit history should be created automatically, tied to the employee user account, and recorded when changes are saved rather than on every keystroke.
- Ordinary users should not be able to edit or delete audit history, and it should remain attached even if the profile is archived.
- For quick visibility, the Overview should also show Created by, Created on, Last updated by, and Last updated on.
